

OOP

OOP..... Not OOPS!!

Object-Oriented Programming Concepts

- What is an Object?
- What is a Class?
- What is a Message?
- Encapsulation?
- Inheritance?
- Polymorphism/Dynamic Binding?
- Data Hiding?
- Data Abstraction?

Java Primitive Data Types

Primitive Data Types:

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)[Not now](#)

- **char** unicode (16 bits)
- **byte** signed 8 bit integer
- **short** signed 16 bit integer
- **int** signed 32 bit integer
- **long** signed 64 bit integer
- **float,double** floating point values

Other Data Types

□ Reference types (composite)

- objects
- arrays

□ strings are supported by a built-in class named **String** (`java.lang.String`) .

□ string literals are supported by the language

Feedback

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)[Not now](#)

- ❑ String color = "Red" ;
- ❑ int borderWidth = 5 ;
- ❑ //.....
- ❑ System.out.println(borderWidth) ;

Custom Data Type

```
public class Shape {  
    Member variables  
    private String color = null;  
    private int borderWidth = 0;  
  
    public int getBorderWidth() {  
        return borderWidth;  
    }  
}
```

```
:Shape  
-color :String  
-borderWidth:int
```

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)[Not now](#)

Method Definition

```
public class Shape {  
    ..  
    public void setBorderWidth(int bw)  
    {  
        borderWidth = bw;  
    }  
}
```

Method

Define attribute/variable

```
□ public class TestShape {  
    ○ public static void main(String[] args){  
        ■ Shape s; //Declaration  
        ■ s = new Shape(); //Instantiation  
    }  
}
```

S is an object here

s is an instance

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)

[Not now](#)

Real World Entities – More Classes

:Person

-name:String
-dob : Date
-address:String
+\$AVG_AGE

:Account

-number:String
-accountType : String
-balance:double

:Automobile

-color :String
-speed:int
-make:String
+\$NO_OF_GEARs

Define A Class - Shape

```
public class Shape {  
    private string color = null;  
    private int borderWidth = 0;  
    public static final float PI = 3.14;  
  
    public int getBorderWidth() {
```

:Shape

-color :String
-borderWidth:int
+\$PI=3.14
+getColor():String

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)

Not now

~~public void setBorderWidth(int bw) {~~~~+setBorderWidth()~~

Constructor

```
Shape s = new Shape();
```

```
public class Shape {  
    private String color = null,  
    private int borderWidth = 0;  
  
    public Shape(){  
        System.out.println(  
            "This is default constructor");  
    }  
.....
```

- Constructor is just like a method.
- It does not have return type.
- Its name is same as Class name.
- It is called at the time of object instantiation (**new Shape()**).
- Constructors are used to initialize instance/class variables.
- A class may have multiple constructors with different number of parameters.

Multiple Constructors

- One class may have more than one constructors.
- Multiple constructors are used to initialize different sets of class attributes.

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)[Not now](#)

- ❑ Constructors those receive parameters are called
Parameterized Constructors

Constructors Overloading

```
public class Shape {  
    private String color = null;  
    private int borderWidth = 0;  
  
    public Shape(){  
        System.out.println("This is  
        default constructor")  
    }  
  
    public Shape (String c, int w){  
        color=c;  
        borderWidth=w;  
    }  
}
```

Shape s = new
Shape()

s.setColor("Red");
s.setBorderWidth(5);

Or

Shape s = new
Shape("Red",5)

Default Constructor

- ❑ Default constructor does not receive any parameter.
 - public Shape(){ .. }
- ❑ If User does not define any constructor then Default
Constructor will be created by Java Compiler

Shape s1, s2

s1 = new Shape()

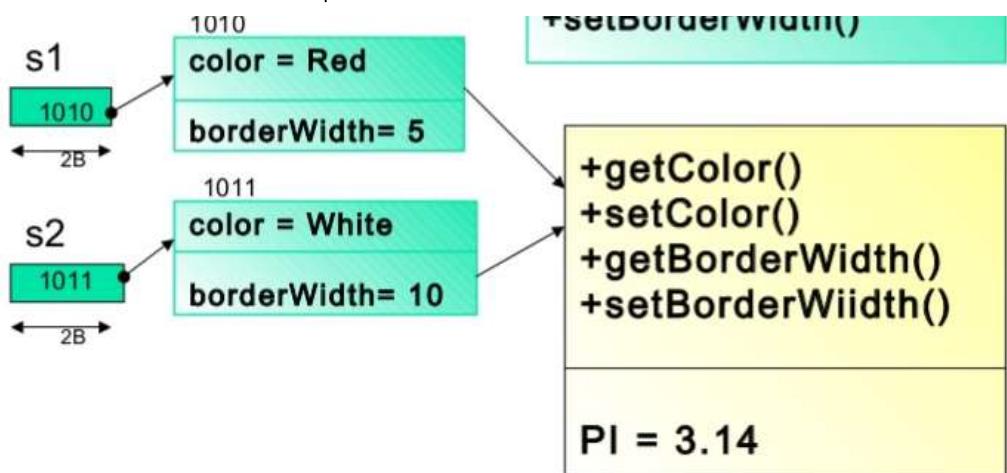

s2 = new Shape()

s1.getColor()

s2.getBorderWidth()

s1.PI

Shape.PI

OOP Key Concepts

❑ Encapsulation:

- Creates Expert Classes.

❑ Inheritance:

- Creates Specialized Classes.

❑ Polymorphism:

- Provides Dynamic behaviour at Runtime.

Encapsulation

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

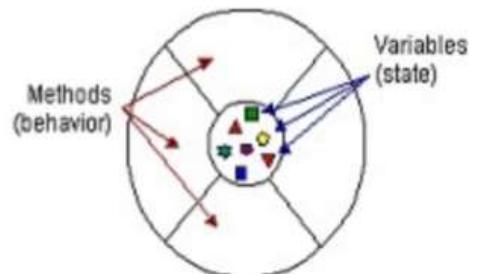

[Take survey](#)
[Not now](#)

Class is called encapsulation.

- Often, for practical reasons, an object may wish to expose some of its variables or hide some of its methods.

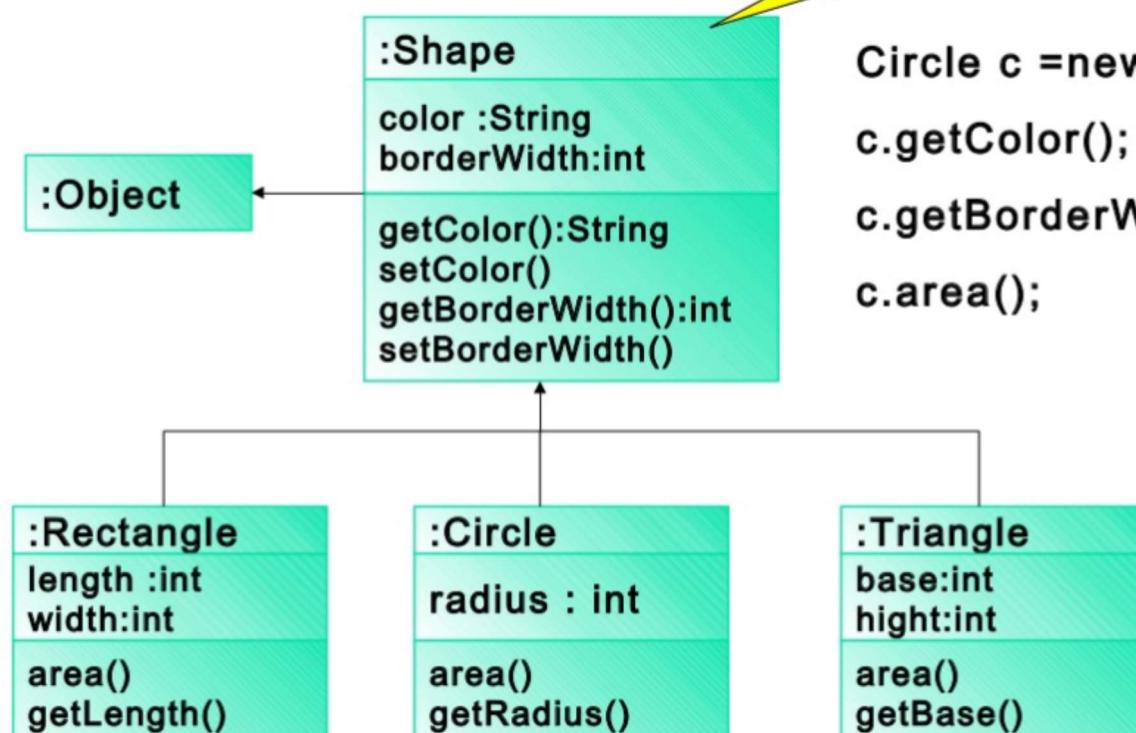

Access Levels:

Modifier	Class	Subclass	Package	World
private	X			
protected	X	X	X	
public	X	X	X	X

Inheritance

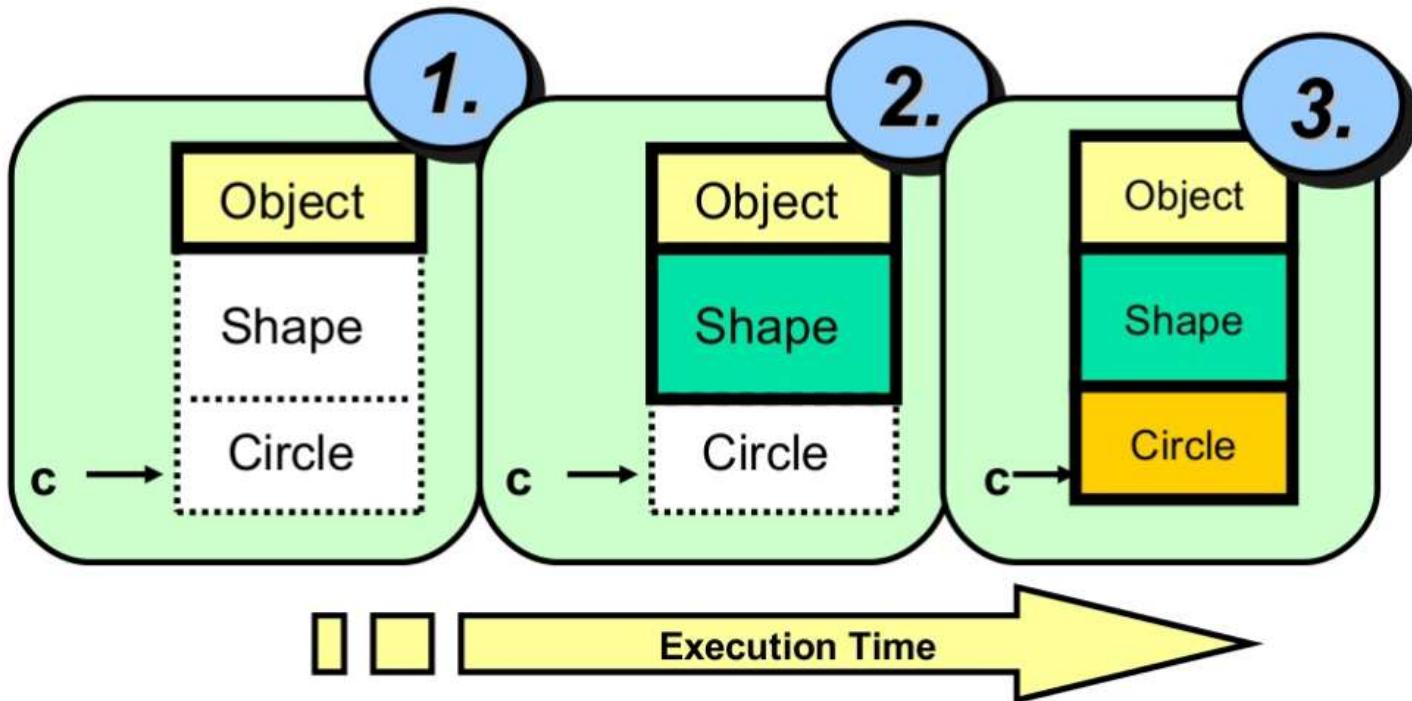

UML Notation

How Objects are Created

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

Parents Can Keep Child's Reference

- `Circle c = new Circle();`
 - `c.getColor()`
 - `c.getBorderBidth()`
 - `c.area()`
- `Shape s = new Circle();`
 - `s.getColor()`
 - `s.getBorderBidth()`
 - `s.area()`
- `Circle c1 = (Circle) s;`
 - `c1.getColor()`
 - `c1.getBorderBidth()`
 - `c1.area()`

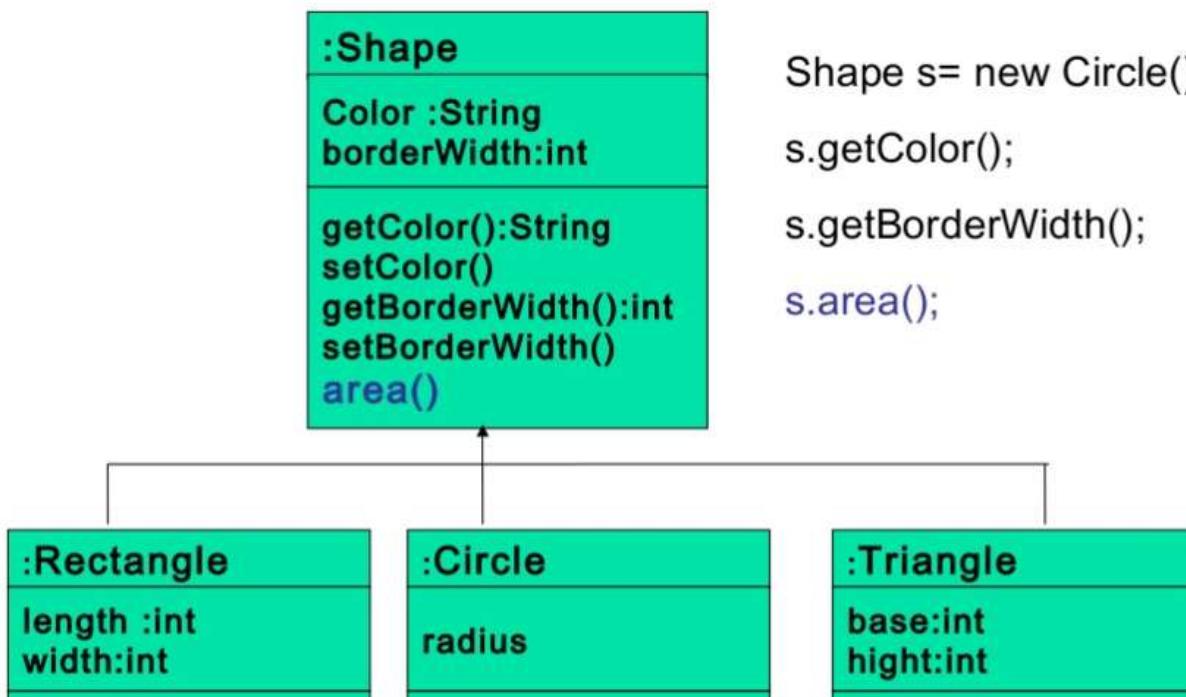

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

Polymorphism

- ❑ Three Common Uses of Polymorphism:
 - Using Polymorphism in Arrays.
 - Using Polymorphism for Method Arguments.
 - Using Polymorphism for Method Return Type.
- ❑ Ways to Provide polymorphism:
 - Through Interfaces.
 - Method Overriding.
 - Method Overloading.

1) Using Polymorphism in Arrays

- ❑ Shape s[] = new Shape[3];
- ❑ s[0] = new Rectangle()
- ❑ s[1] = new Circle()
- ❑ s[2] = new Triangle()

s[0]:Rectangle
color
borderWidth
length = 17
Width = 35

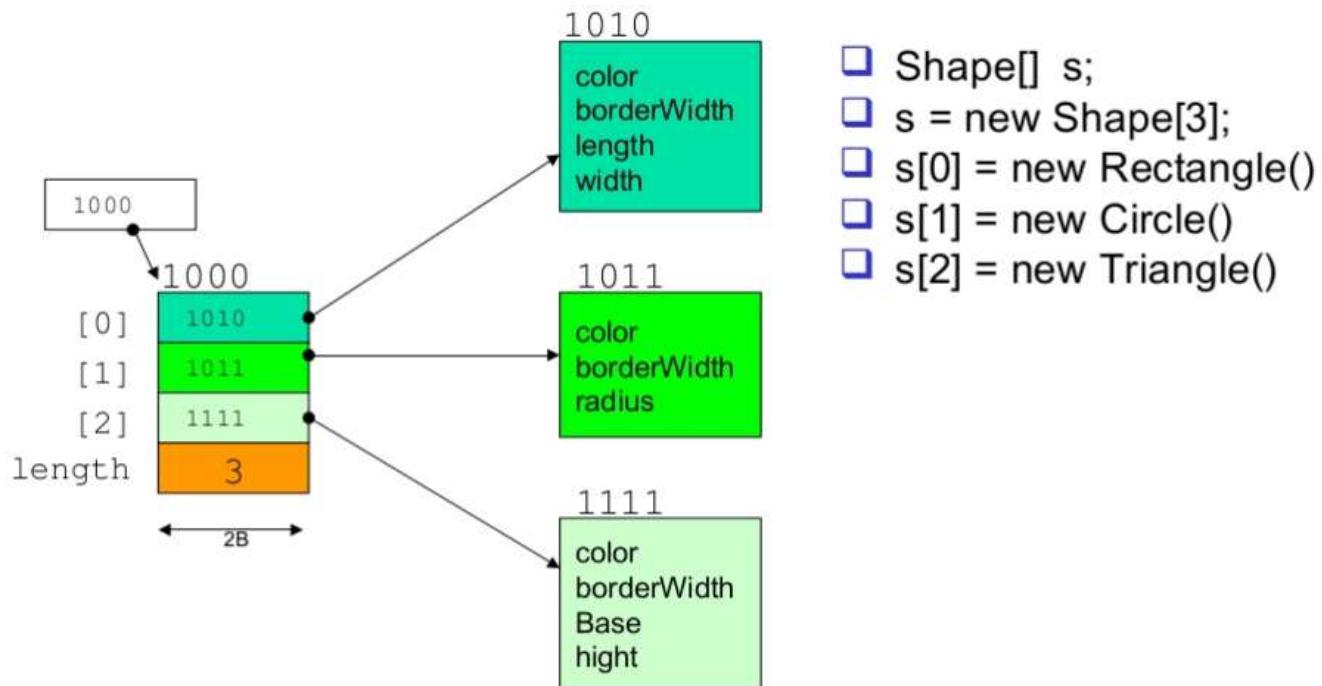

s[1]:Circle
color
borderWidth
radius = 11

s[2]:Triangle
color

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)[Not now](#)

1) Using Polymorphism in Arrays

- `Shape[] s;`
- `s = new Shape[3];`
- `s[0] = new Rectangle();`
- `s[1] = new Circle();`
- `s[2] = new Triangle();`

2) Using Polymorphism for Method Arguments

```

public static void main(String[] args) {
    Shape[] s = new Shape[3];
    s[0] = new Rectangle();
    s[1] = new Circle();
    s[2] = new Triangle();
    double totalArea = calcArea(s);
    System.out.println(totalArea);
}
public static double calcArea(Shape[] s) {
    double totalArea = 0;

    for(int i = 0; i < s.length; i++) {
        totalArea += s[i].area();
    }
    return totalArea;
}

```

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?

[Take survey](#)

Not now

3) Polymorphism using Return Type

```
public static Shape getShape(int i) {  
    if (i == 1) return new Rectangle();  
    if (i == 2) return new Circle();  
    if (i == 3) return new Triangle();  
}
```

Method Overloading

❑ PrintWriter

- `println(String)`
- `println(int)`
- `println(double)`
- `println(boolean)`
- `println()`

We want to make Evernote better. Your feedback means the world to us. Can you take a minute to tell us how we're doing?
